

Chap. 5b

Applications:

Invariants over group means

- visual inspection tasks (fabrics)
- image search engines (query by example)
SIMBA and MICHELSCOPE
- automatic classification of pollen

Visual inspection of textiles with anisotropic texture

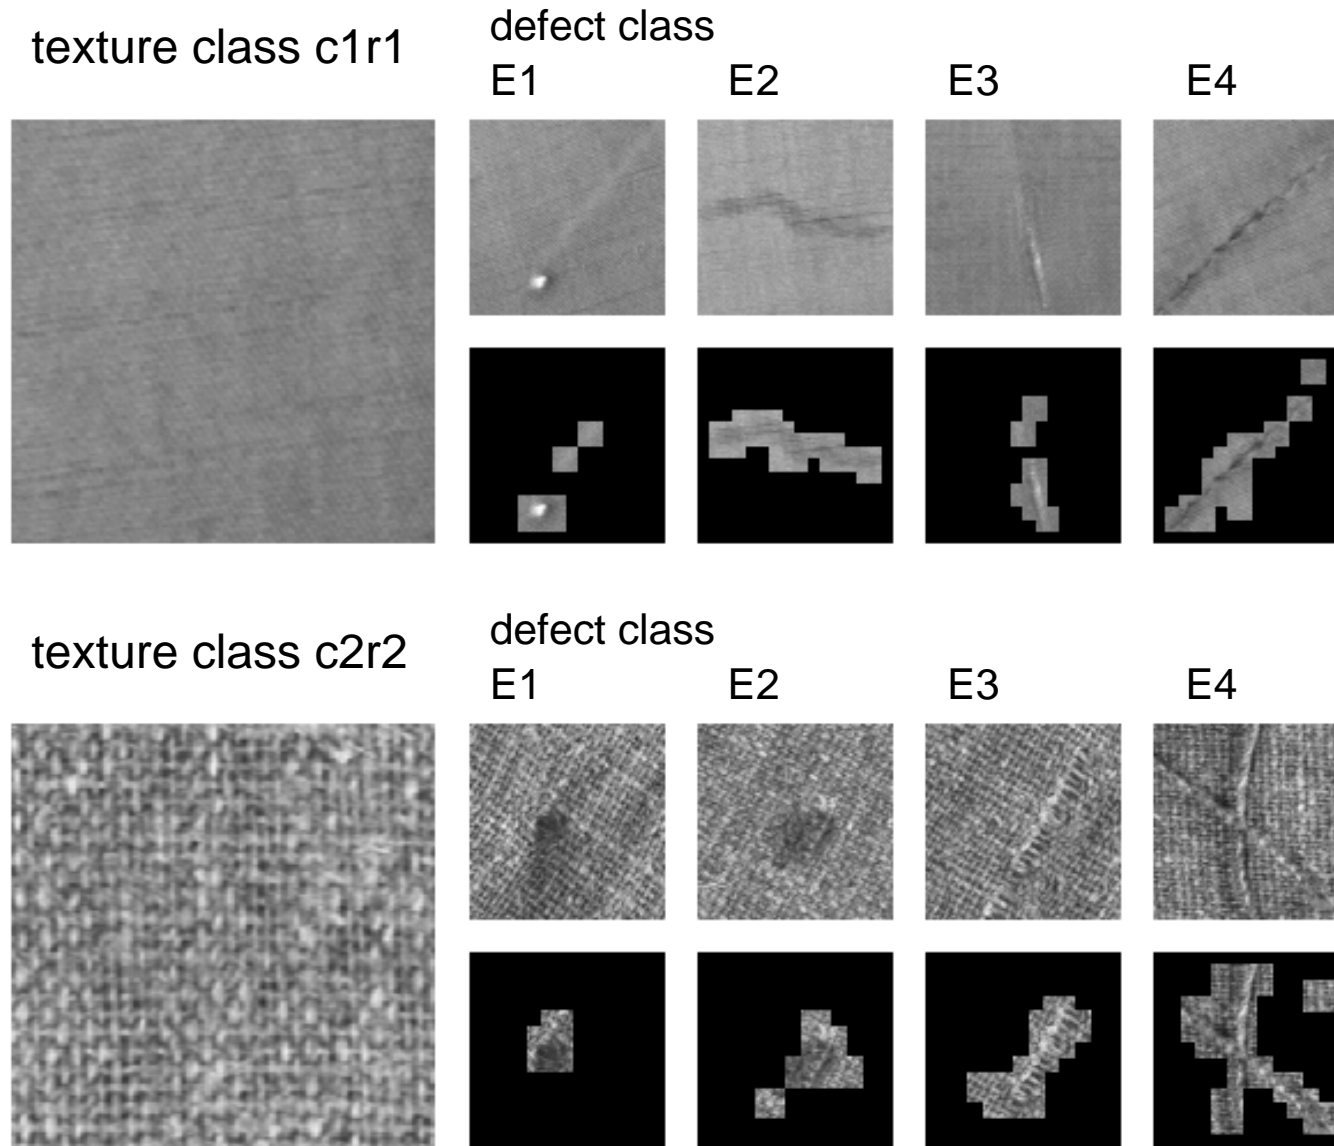

Textile database TILDA

<http://www.informatik.uni-freiburg.de/~lmb/tilda> (ca. 3200 images)

Texture defect detection for textiles/fabrics

Segmentation of the defects

Texture defect detection for textiles/fabrics

Discrimination of the defect classes

class distances texture class c1r1

class distances texture class c2r2

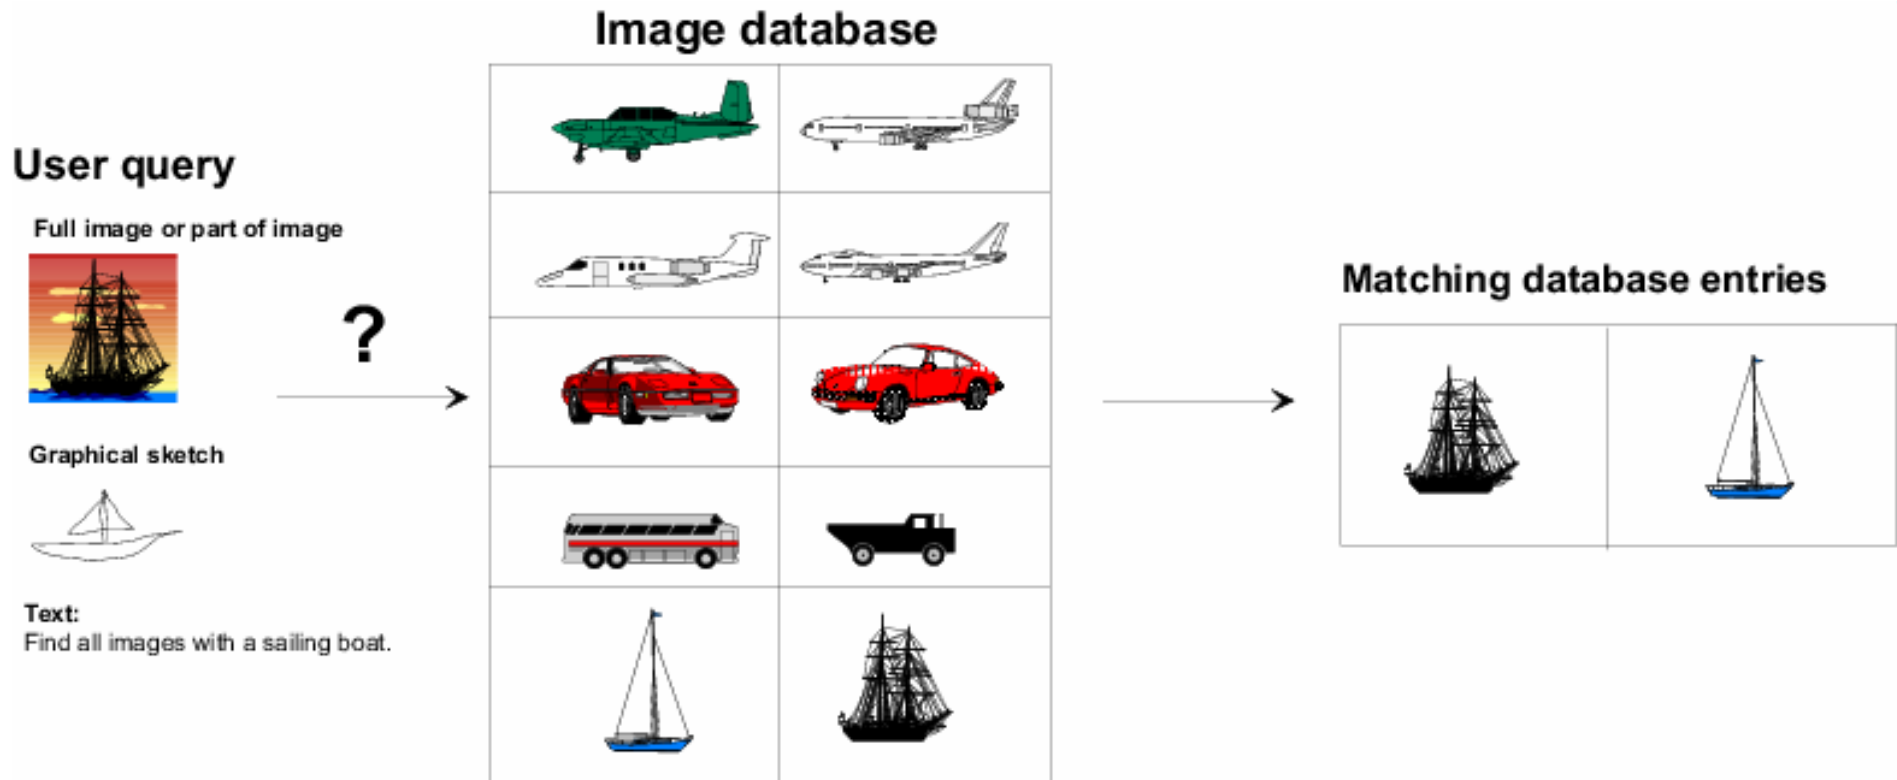

Texture defect detection on steel surface areas

Segmentation of the defects

	 96.42	 96.02	 95.85
	 95.26	 93.13	 91.60

Robustness to scaling

- Database as before, grayvalue features only
- Kernels $\mathbf{M}(1,0)\mathbf{M}(0,2)$, $\mathbf{M}(2,0)\mathbf{M}(0,4)$
- Images reduced/zoomed (bilinear interpolation) to scales from 0.7 to 2.4
- Database contains scales 1.3 and 1.7 only

→ Good recognition from scale 1 to 2.2, i.e. scale 4.8 in area

Project “automatic pollen recognition” - Electron microscopic pollen images

hazel

alder

birch

grass

rye

mugwort

+ 33 further species (not relevant for allergies)

Hazel pollen

Daisy pollen grain

Taxus

Integration over the 3D Euclidian motion

Reference Data Base Description

- 26 pollen species directly sampled from the plants
 - Correctly assigned species
 - Maybe less variation in size and shape compared to airborne pollen (no different sub-species, no regional variation)
 - No deformation or contamination or agglomeration
- Recording 3D volumes of about 15 samples of each species with a Confocal Laser Scanning Microscope
 - No distortions of the data due to imperfect imaging of a usual microscope

Automated Pollen Recognition in Air Samples by Digital Microscopy

O. Ronneberger, U. Heimann, V. Dietze, E. Schultz

► Motivation

- Time-consuming, but still inaccurate visual pollen counting

► Demand

- Reliable pollen data for pollen forecast

► Approach

- 3D fluorescence imaging (tomography) instead of 2D conventional translucent microscopy
- Image recognition based on general »grey scale invariants«, instead of traditional object specific features

► First results (see table on the right)

- »Grey scale invariants« have characteristic shapes for different pollen species
- Recognition rate of 82% already in a first run

► Outlook

- Employment of digital microscopy for automated particle analysis in general.

Pollen species	Grey Scale Invariants	No.	Mis-classifications
Maple		5	1 (1) → Goose.
Birch		8	3 (1) → Alder (3) → Alder (1) → Alder
Yew		2	-
Alder		10	2 (1) → Birch (1) → Birch
Goosefoot		7	-
Hornbeam		2	-
Hedera		10	2 (1) → Goose. (1) → Alder
